

EAM Mobile

EAM Mobile from OSSuite™ gives you mobile access to an Enterprise Asset Management (EAM) solution. Your maintenance and operations personnel can access the mission critical information they need at the point of work. Anytime, anywhere, access lets field personnel see their tasks, initiate work notifications and work orders, and close out assignments without having to be in front of a computer screen.

Maintenance personnel can access schedules, bills of materials, and job plans. When maintenance and operations personnel have what they need, when they need it, companies see improvements in work accuracy and overall efficiency.

What can your workforce do with an EAM mobile solution, right from their mobile device?

- Initiate new requests or work orders as required
- Perform, assign and record activities
- Take pictures and post them to the job record
- Access documents from a mobile device
- Redline documents on the fly while walking down P&IDs
- Scan a barcode to get information on an asset
- Download work orders from the database and re-assign them as required
- Link work orders to MOCs, Work Packs, Inspections and other OSSuite™ modules
- Track hours worked
- Issue and return parts and consumables
- Create to-do lists
- Conduct condition assessments
- Access operating and maintenance procedures / work instructions
- Electronically sign off on work performed
- Use visual operations to aggregate information including work order histories and parts catalogs
- Complete the work order requirements from the field including condition assessment

Users can improve the efficiency of maintenance and operations by 20% through automating tasks and improved response time. The EAM Mobile module simplifies the tracking of work performed by aggregating cross functional requirements. This process is further optimized by triggering MOC, Computerized Maintenance Management System (CMMS), and Inspection requirements to help assure regulatory compliance and overall reliability.

EAM Mobile works both offline and online with full native support of any operating system and browser. Personnel can use company-approved tablets or phones to capture pictures, update tasks, and close out assignments on the fly. Supervisors or managers in other areas of the facility can see how a project is progressing and can aggregate key data on assets based on comprehensive, accurate, to the minute input from the field.
