

Incident Management

The Operational Sustainability, LLC, **OSSuite™ Incident Management (IM) Module** is a holistic, comprehensive unwanted events solution. Identify, track, and prevent Environmental, Health and Safety issues such as slips and spills, maintenance issues such as unplanned equipment outages, automation issues like alarms, and quality issues such as off-spec product or customer complaints. IM is a cloud-based, mobile enabled loss prevention system allowing users to uncover and track root causes, lessons learned, and corrective actions. Our Visual Operations technology enables users to correlate an equipment failure to the plot plan, process flow diagram or P&ID level. In addition, users can create Behavior-Based Safety (BBS) observations and use Pareto charts to diagnose the causes of behaviors. The IM module goes beyond event-based intelligence to asset-based intelligence by integrating seamlessly with the OS Work Management module to show trending of repeat bad actors and lost profit opportunities.

Occupational Injury Function

OSSuite™ includes a comprehensive occupational illness and injury logging and tracking system complete with incident logs per OSHA 300 / 301 so users can look for trends of injuries by body part or other pertinent filters. Many of the leading Root Cause Analysis (RCA) methodologies are also enabled in OSSuite including TapRoot®, Apollo™, SCAT, and the 5-Whys. The software's digital forms technology uses a single point of entry for Behavior-Based Safety (BBS) observations and RCAs in the field.

Business Impact

- Event-based as well as asset-based intelligence via integration with the OS Work Management module.
- Enable real-time visibility of incidents and recurring problems.
- Reduce time spent logging incidents and searching for lessons learned from previous incidents.
- Reduce incidents from EH&S, maintenance, automation and quality perspectives over time.
- Flexible architecture that allows users to initiate, manage, and close out simple and complex incidents.
- Customized workflows for each incident type based upon the client needs and culture.
- Report multiple consequences, each with specific details, for each incident along with detailed occupational illness and injury information.
