

Incident Mobile

Operational Sustainability, LLC (OS) offers the **OSSuite™ Incident Mobile module** as part of its overall mobility platform to help companies simplify reports of incidents in the field. Incident Mobile enables both field personnel and managers to log near-misses and first report of incidents right from their mobile device.

Take pictures and document details to support the incident investigation. Include injury and illness information such as the time of the incident, affected body parts, clinic and hospital information. Incidents involving spills can include spill quantity, duration of release, offsite impacts, and any meteorological information. Incident Mobile integrates with leading systems such as SAP PM, and IBM MRO (formerly Maximo) to automatically relate equipment information in an incident report to an equipment failure, and enable work orders to be initiated from the field to repair damaged assets. Users can conduct Root Cause Analysis (RCA) using numerous methodologies including TapRooT®, Apollo, SCAT, and 5-Whys on a tablet.

Lessons learned and corrective actions can also be documented along with initiating a management of change process if needed.

Incident Mobile works both offline and online. Personnel can use tablets or phones to capture pictures and notes on the fly, save them to Offline mode, and then work on them or review them anywhere. Our advanced analytics, alerts, and notifications enable rapid escalation when abnormal patterns or threats are detected.
