

Inspection Mobile

Operational Sustainability, LLC (OS) offers the **OSSuite™ Inspection Mobile module** as part of its overall mobility platform to help companies take advantage of and deploy numerous mobile forms and workflows. Inspection Mobile enables both field personnel and inspectors to record thickness measurement readings, view historical data/trending, and to evaluate the remaining half-life of equipment right from their mobile device.

In addition, inspectors can track visual inspection information using easily configurable forms to capture checklist results, images, and comments from activities such as:

- Tank External and Internal Visual Inspection
- API – 510 Pressure Vessel External and Internal Inspection
- API – 570 Piping External Visual Inspection
- Fiberglass Internal/External Visual Inspection
- Site/Area Visual Inspection
- Level 1 Fitness-for-Service (FFS) evaluations

OSSuite™ improves the workflow and the efficiency of work notifications and work orders in the field. With both offline and online modes, personnel can use tablets and phones to capture pictures and notes on the fly, save them to Offline mode, and then work on them or review them anywhere. In addition, OSSuite™ Inspection Mobile includes redlining capability for easy annotation of drawings, photos, and documents. Users may also download reference documents such as drawings, manuals, and procedures for Offline access in the field.

As inspection data is gathered in the field, the module helps personnel spot equipment trends from previous field visits and will generate alerts if limits are exceeded (i.e. TMIN). Findings captured during the inspections are integrated with the Corrective Actions module and will trigger necessary workflows when indicated.

OSSuite™ Inspection Mobile is also integrated with our Operator Rounds module to ensure maximum work efficiency. Our advanced analytics, alerts, and notifications enable rapid escalation when patterns outside the norm and threats are detected.
