

Task/Compliance Management

Task/Compliance Management (TCM) with OSSuite™ is designed to manage tasks and compliance activities. Users can create tasks on a one time, recurring, or rolling recurring basis by the responsible person or team. Tasks can be data or event driven. These tasks can be aggregated to a calendar view making it easier for the Users to quickly drill in and close them out. The calendar view can also project the recurring tasks into the future for planning purposes.

The tasks can be categorized into different types to track different information. The flexible forms can be configured to store different sets of information according to the needs. For example, audit tasks can be associated to the Audit module where the User can access the Audit records and schedule directly from the TCM. These configurations can be done via the User Interface.

TCM is integrated with our Performance Management module to track data collected from the fields such as pH readings, opacity for flue gas, etc. The tasks can also be setup to track the verification of completion. The manager/supervisor can see all of the completion details including status, comments, follow-up, all the recurrences and status of each recurrence in a single view. The e-mail notifications can be setup to send advance, due, and overdue notifications at the task level to any stakeholders with configurable e-mail information for different schedules.

This solution can track any regulatory information such as permit information, citations from different regulatory agencies or even corporate policies. This information can be associated to individual tasks. The module offers a means to track all time-dependent 'tasks' from any source including Maintenance, Reliability-Centered Maintenance and EHS compliance tasks. OSSuite™ is integrated with content providers such as BNA and ENHESA. In addition, users can defend the basis of their compliance decision by applying regulatory applicability such as OSHA, Title V citations, and Process Safety citations.
